

RapideL to Enable Creation of Courses Based on Adaptive Learning Techniques (Feb 20)

Pune, India — Feb. 20

RapideL, the rapid e-learning authoring solution innovated by Brainvisa, shortly will launch its adaptive learning version, wherein courses can be created using a nonlinear navigation path that depends on the learners' response to content.

This method will ensure a high retention rate of the learner, which is the highest priority for a trainer.

RapideL will provide support for building simple branching courses, using an intuitive interface to build the branching logic.

It also will provide interactive and non-interactive Flash templates for creating the branched course.

RapideL, the rapid e-learning tool developed by Brainvisa, enables instructional designers and subject-matter experts to write content in basic MS-Word authoring interface and create engaging e-learning courses in Flash.

RapideL 3.1 comes with project management capabilities such as online review mechanisms, issue tracking and the ability to publish Web versions.

It promotes collaborative development over the network or the Web while also working as a stand-alone tool without multiple installations.

It allows publishing with track changes and support for language localization.
